* $P < .05$.

MT, mechanical thrombectomy.

ASPECTS, alberta stroke program early CT score

Lesions without DWI reversal assessed by MRI DWI/ADC. DW, ADC, and MRA images show lesions without reversal of the left frontal ischemic lesion 24 h after mechanical thrombectomy for M1 occlusion. The ADC values (mean, maximum, minimum) without reversal are measured in the ROIs (white circle area with dotted line) at the pre-treatment MRI and each parameter is averaged. The ADC values of lesions without DWI reversal (mean, maximum, minimum) are 303×10^{-6} mm²/s, 489×10^{-6} mm²/s, and 155×10^{-6} mm²/s, respectively.
